Whiteboard PP Dryapply ASLAN WBL 998

The films are writable with standard whiteboard markers. Writings can be easily wiped away dry without leaving ghostings. We recommend using smooth cloths or sponges. Accidental writings on the films with improper pens like permanent markers can be wiped away using cleaners containing alcohol or benzene.

Matt whiteboard films

FerroSoft Whiteboard matt ASLAN FF 490

The films are writable with standard whiteboard markers. Certain markers have a lower amount of colour pigments and are therefore easier to wipe away (e.g. Staedtler Lumocolor). Use a microfibre cloth for easy cleaning. For accidental writings with permanent markers use a cleaner containing a high amount of alcohol or methylated spirit.

Important

It is not recommended to use application tapes. Pulling of the application tape may damage the film's writable surface and it is not guaranteed that writings can be wiped away. If application tapes are necessary, we would recommend a low-adhesion tape. The application tape must always be removed from the middle towards film's edge.

Magnetically-receptive ferrous films

FerroSoft ASLAN FF 410

Important

We recommend using magnets with high magnetic power, e.g. standard neodym magnets, to reach an optimal magnetic adhesion.
